Ex.No:10	HTML FORM REQUEST HANDLING USING NODEJS AND MONGODB

Description:

- Node.js allows you to run JavaScript outside the web browser.
- Used to create both client and server-side applications (Full Stack Web Application Development).
- Node JS is single threaded application environment.
- A single response for all the requests.
- NodeJS best suitable for creating websites and web applications which contain less CPU-intensive tasks.

Sample Node JS Program for Practice

home.html

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta name="viewport" content="width=device-width, initial-scale=1.0"
/>
    <title>Home Page</title>
  </head>
  <body>
    <h1>Registration Form!</h1>
    <br>
    <form action="/server" method="post">
      Data1: <input type="text" name="data1"><br><br>
      Data2: <input type="text" name="data2"><br><br>
      <button type="submit">Submit</button>
    </form>
  </body>
</html>
```

app.js

```
var http = require('http');
const fs = require('fs');

const server = http.createServer(function (req, res) {
  if(req.url==='/'){
    res.writeHead(200,{"Content-Type": "text/html"});
    fs.createReadStream('./home.html').pipe(res);
  }
  else if(req.url ==='/server' && req.method == 'POST'){
    var rawData = '';
    req.on('data',function(data){
       rawData += data;
    })
    req.on('end',function(){
        var inputdata = new URLSearchParams(rawData);
        res.writeHead(200,{"Content-Type": "text/html"});
        res.write('Data 1: ' +inputdata.get('data1') + '<br>');
        res.write('Data 2: ' +inputdata.get('data2') + '<br>');
        res.end();
    });
  }
});

server.listen(2000,function(){
  console.log('listening at 2000')
});
```

Mongodb sample code:

```
var MongoClient = require('mongodb').MongoClient;
var url = "mongodb://localhost:27017/";

MongoClient.connect(url, function(err, db) {
  if (err) throw err;
  var dbo = db.db("mydb");
  var myobj = { name: "Company Inc", address: "Highway 37" };
  dbo.collection("customers").insertOne(myobj, function(err, res) {
```

```
    if (err) throw err;
    console.log("1 document inserted");
    db.close();
  });
});
```

Sample Questions

Create a Node JS Server application for designing new user registration HTML form page and process all the HTML Form details and display the same when the form is submitted.

When the server URL is http://localhost:6000 is executed display the home page as given below [All fields are **mandatory** and use predefined html form validator also]

When the submit button is clicked, the URL changes to http://localhost:6000/server and should initiate storage of data from the forms to MongoDB and display the user entered details in table format as given below from database.

User Submitted Details

Name	John David
Password	abc123tt
Age	30
Mobile Number	9923457891
Email	johndavid@gmail.com
Gender	Male
State	Kerala
Skills	Java Script, C++
